pymatgen installation instructions

For details about the package, see here:

<https://pymatgen.org/> (<https://pymatgen.org/>)

The following guide assumes that you have already installed python. I recommend the most recent 64bit distribution, but have only tested on Python version 3.9.6 (tags/v3.9.6:db3ff76, Jun 28 2021, 15:26:21) [MSC v.1929 64 bit (AMD64)]

1. Installation on windows requires the c++ buildtools. If you have not already done this, you will get the error: Microsoft Visual C++ 14.0 or greater is required. Get it with "Microsoft C++ Build Tools": <https://visualstudio.microsoft.com/visual-cpp-build-tools/> (<https://visualstudio.microsoft.com/visual-cpp-build-tools/>).
2. Click download build tools and run the downloaded program, providing the admin username and password for the given computer.
3. Select the checkbox for the first item "Desktopentwicklung mit C++" and the default optional packages are enough. See the screenshot in the following cell for a visual guide. Note that you can just click "install" at the bottom right. The example screenshot is from a computer where buildtools was already installed.
4. Open a command prompt as administrator and run the command "pip install pymatgen" without the quotes. this may take some time to finish as various dependencies are also installed.
5. For visualization install the visualization toolkit via "pip install vtk"
